PREFACE (U)

(U) This working paper contains a technical evaluation of the World Wide Military Command and Control System (WMCCS) performance in a post-nuclear attack environment. Special emphasis is placed on the ability of the WMCCS to perform its post-attack, reconstitution, and redirection missions. A major goal of this effort is to establish a baseline from which more realism can be inserted into the performance of major WMCCS reconstitution exercises. Another goal in this effort is to provide a reference for the JCS Exercise Controllers that may be used in the planning, conduct and evaluation of the upcoming JCS Command Post Exercise.

(U) This work was performed by SRI under sponsorship of the Defense Nuclear Agency (DNA). It was prepared in support of the WMCCS Evaluation Program directed by the Organization of the Joint Chiefs of Staff (WMCCS Operation and Evaluation Division, J32).

CONTENTS

PREFACE . . . . . 1

LIST OF ILLUSTRATIONS . . . . . 5

LIST OF TABLES . . . . . 11

I INTRODUCTION . . . . . 1-1

II ANALYSIS TECHNIQUES AND CONSTRAINTS . . . . . 2-1

    A. Data Base . . . . . 2-1

        1. Facility Identification and  
           Damage Assessment . . . . . 2-1

        2. Communication Connectivities . . . . . 2-1

    B. Method of Approach . . . . . 2-3

        1. General . . . . . 2-3

        2. Communication Systems and Networks . . . . . 2-3

        3. Identification of Nodes, Damage, and  
           Residual System Performance . . . . . 2-8

        4. Fallout Hazards . . . . . 2-14

        5. Vulnerability of Generic Systems . . . . . 2-17

III WWMCCS PERFORMANCE ASSESSMENT . . . . . 3-1

    A. Scenario Description . . . . . 3-1

    B. Physical Damage to Key Facilities . . . . . 3-4

        1. North American Theatre . . . . . 3-4

        2. European Theatre . . . . . 3-4

        3. Pacific Theatre . . . . . 3-6

    C. Emergency Relocation Sites and CINC's  
       Communication Assets for POLE VAULT . . . . . 3-7

    D. Detailed Analysis of NCA and Theatre  
       Communications . . . . . 3-10

        1. NCA Communications . . . . . 3-10

        2. European Theatre . . . . . 3-14

III WNWCCS PERFORMANCE ASSESSMENT (Continued)

(U) The information in this report represents an estimate of the likely status of the WWCSS that is consistent with current technology and with our understanding of the 1975 WWCSS configuration.

1-2

PAGE 1-1 WAS DELETED

(U) Section IV provides an overview and synopsis of the WWCSS status by theatre and is appropriate for POLE VAULT initial conditions.

## II ANALYSIS TECHNIQUES AND CONSTRAINTS (U)

(U) Some errors and omissions regarding locations of command headquarters, emergency relocation sites (ERS), and other key facilities are likely to be found in this report. They result because of recent changes in the C<sup>3</sup> structure and locations of designated ERS. The NMCSSC data base<sup>1</sup> used in this analysis was dated 10 March 1975.

(U) We have relied heavily on the Computer Science Corporation (CSC) data base<sup>2</sup> in our analysis of NCA to Theatre communications. The CSC data base was developed as a part of the DNA-sponsored

INCA program and is in a form particularly convenient for this analysis. It includes an identification of the nodes, intermediate points, routings, and the various systems that utilize the routings.

(U) Several supplementary sources were used to describe intratheatre force connectivities for the Pacific and Europe. They include an analysis of European C<sup>3</sup> performed on the DXA INCA program,<sup>4,5</sup> charts showing the worldwide DCS connectivities,<sup>6</sup> Exercise POLE VAULT '76,<sup>7,8</sup> documents provided to us by the OJCS to describe conditions for the POLE VAULT exercise, and, a document prepared by the United States Air Force Academy<sup>9</sup> that addresses our strategic C<sup>3</sup> system. Finally, our brief assessment of the DCPA communications was based on data provided to SRI by the OJCS.<sup>10</sup>

(U) Because the theatre connectivities were often derived from several independent sources, the connectivities may be subject to some errors in our interpretation. Such errors may affect the details of our communication analysis but not the substance.

1. (U) General

(U) The analysis procedures used to determine the WMCOS status during PRIME RATE and at the onset of POLE VAULT involve four steps. These steps are as follows:

- (1) Identify the communication systems and networks utilized by the NCA and by the Theatre Commander.
- (2) Identify the routings for the various systems that support communications from NCA to CINC and from CINCs to forces and assess the facility damage to the nodes and to intermediate points along the paths.
- (3) Assign a figure of merit to measure communication capability.
- (4) Identify regions of intense radiation fallout.

(U) The characteristics (transmission medium, information type, transmission rate, transmission security, and types of circuit) are summarized in Table II-B-2-1 for most of the above systems.

(U) Recognizing that there are several breakouts of these functions, we have used the following so-called Minimum Essential Functions:

- (1) Situation Monitoring/Current Intelligence
- (2) Forces and Resources Status Monitoring
- (3) Attack Assessment
- (4) Select, Execute, and Terminate
- (5) Operations Monitoring
- (6) Strategic Replanning and Retargeting
- (7) Redirection and Reconstitution
- (8) Damage Assessment/Strike Assessment
- (9) Civil Responsibilities.

(U) The merit figure or weighting of the capability for each path (Table II-B-3-1, Column 4) was derived by dividing the number of MEFs (Minimum Essential Functions) carried on each path by the total number of MEFs carried by all paths to the appropriate CINC. Using Europe as an example, there are seven paths identified having specific routes that carry a total of 28 formatted MEF messages. The weighting for the individual paths (Column 4) was obtained by dividing the number of MEFs carried by that path by 28, thereby establishing a percentage for that path. This figure of merit allows us to measure the stress degradation in percent as a function of time with respect to the unstressed 100% capability. A hypothetical example\* of the figure of merit is shown in Figure II-B-3-2. First, a 100% capability is shown for the unstressed NCA to CINC circuits shown in Figure II-B-3-2(b). At time notation (1) on the capability plot [Figure II B-3-2(b)] there is a loss of 25% capability in this instance meaning that one 25% weighted circuit is out. Figure II B-3-2(b) shows that the AUTODIN (D) circuit

\* (U) This example was made up for illustrative purposes only. It is not a true representation of NCA to CINC capability.

(U)

was lost. At time notation (2) one of two possible routes for AUTOVON is out. This degrades that circuit by one-half (50%) of its 30% full capability. At time notation (3), the ANMCC was destroyed and the NCA communications to the CINC are from the NEACP via the GEP. Since, in this example, the GEP is tied only to the JCSAT (J) circuit, NEACP does not have access to V, E, and JA, and the capability drops to the 25% level. The dashed line in the capability plot indicates the NCA communication capability from the NEACP only.

(U) There are no other outages shown in this example for the other circuits; thus, ENATS (E) and Automatic Conferencing Arrangement and the second AUTOVON route (V) retain their connectivity to the ANMCC. At time notation (4), command returns to the ANMCC and its capability then becomes that of the remaining circuits (JA, E, J, and V) and is measured at 60%. This procedure was used to provide a figure of merit of the communication capability for all CINCs. Detailed circuits for each CINC are also presented and node degradations are shown at selected time intervals by shading and removing the connecting circuit. The outage time of the node is also indicated.

#### 4. Fallout Hazards (U)

(U) Any attempts at reconstructing communications must be tempered by the fallout hazards in the area under consideration--i.e., personnel cannot be expected to remain in the open areas indefinitely in order to work on their equipment. Depending on the intensity of the fallout, they can be expected to remain in shielded locations for part of each day, work in an unshielded area for another part of the day, and go through a decontamination process after exposure. The time of exposure should of course be dependent on the level of fallout. Exposure to 200 rads is rather serious. The urgency for site recovery may not

(U)

warrant such a risk. So then, one might wish to know how long the exposure period would be at H + 1 day in order to accumulate the limiting exposure of 200 rads for several dose rates as shown below:

<u>Dose Rate</u> <u>(rads/hr)</u>	<u>Exposure Period</u> <u>(hrs)</u>
50	4.5
10	34
2	Months

(U) An example of the fallout hazard assessment is shown in Figure II-B-4-1. It consists of the above isodose rate contours over areas of England where significant fallout occurred and potential radiation hazards exist at H + 8 days. The designated national command facilities and airfields in our data base are also included on the map.

(U) The SRI-developed Damage Assessment Computer Program (DACOMP) was used to compute the radiation dose rates in R/hr at 24 hours. A segment of the DACOMP<sup>11</sup> is the SEER II<sup>12</sup> fallout model, also developed at SRI.

(U) The contours of fallout, such as those illustrated in Figure II-B-4-1, were determined by using the typical meteorological conditions that existed in March 1975, the period over which the exercise took place. At the time that the fallout contours were calculated, JCS EXPLAN 008 (Ref. 7) was not available, so the standardized conditions adopted by the OJCS were not used.

5. Vulnerability of Generic Systems (U)

(U) To assess the vulnerability of WWCSS assets to nuclear effects, the assets can be conveniently divided into three categories according to their physical location in the three distinct regions of the environment:

- (1) Satellites (space)
- (2) Aircraft (atmosphere)
- (3) Land-based (surface).

(U) Included in the third category are command posts, airfields, ground-based radio and radar systems, and satellite ground terminals.

(U) Similarly, the potential nuclear-induced degradations to C<sup>3</sup> assets are divided into three general areas:

- (1) Physical damage
- (2) Propagation failure
- (3) Personnel injury.

### III WNWCCS PERFORMANCE ASSESSMENT (U)

#### A. Scenario Description (U)

(U) The attack scenario associated with the PRIME RATE exercise is not a full-scale RISOP attack and was not intended to destroy U.S. C<sup>3</sup> capability. Rather, its purpose was to place stresses on the C<sup>3</sup> system. Connectivity existed between the NCA and all Theatre Commanders throughout PRIME RATE exercise and the onset of POLE VAULT.

(U) The sequence of events in the scenario developed over a period of several days. It commenced in Europe in early March 1975 with an attack by conventional weapons. An exchange of tactical nuclear weapons began on March 11 and the situation deteriorated until, finally, a large-scale worldwide nuclear attack was initiated at 1500 on 13 March, 1975-- the time we refer to as H-hour. The number and yields of the nuclear detonations that occurred throughout the scenario are shown in Figure III-A-1 for the CONUS, European and Pacific theatres, respectively.

B. Physical Damage to Key Facilities (U)

(U) The following brief discussion identifies the facilities the destruction of which would have the greatest impact in determining the WWCOS' status during PRIME RATE and at the onset of POLE VAULT.

2) USCINCEUR to Ground Forces (U)

(U) The communications degradation/reconstitution applicable to ground forces are shown in the following figures:

- Figure III-D-2-11 - USCINCEUR/USAREUR to Forces Configuration--Unstressed
- Figure III-D-2-12 - USCINCEUR/USAREUR to Forces Configuration--Stressed
- Figure III-D-2-13 - USAREUR to CORPS Paths

4) USCINCEUR to Air Forces (U)

(U) The status of communications between USCINCEUR and the Air Forces is shown in the following figures:

- Figure III-D-2-16 - USCINCEUR/USAFE to Forces Configuration--Unstressed
- Figure III-D-2-17 - USCINCEUR/USAFE to Forces Configuration--Stressed
- Figure III-D-2-18 - USAFE to Airfields Paths

(U) Figure III-D-2-19 provides detailed descriptions of the communications links connecting USCINCEUR, USAFE, and the primary and alternate airfields.

3-46

PAGES 3-47 THROUGH 3-124  
WERE DELETED

3) (U) MOLINK Status

(U) Negotiations between the United States and the USSR are conducted via the MOLINK. MOLINK routings are shown in Figures III-D-6-10 and 11 for the unstressed and stressed conditions, respectively. The Etam and Ft. Detrick SATCOM terminals remain operational on the CONUS side of the linkage. The status of the nodes on the USSR side after SIOP execution is not known to us (this situation is indicated by the use of quotation marks to highlight the "Moscow" node in Figure III-D-6-11).

IV SYNOPSIS OF W2MCCS PERFORMANCE  
ASSESSMENT (U)

(U) The purpose of this synopsis is to provide an overview of the conditions at the beginning of POLE VAULT. Condensations of the detailed path/link analyses for each CINC are presented in the illustrations and tables in this section.

(U) Where a headquarters was destroyed, the information shown describes the communications to its alternates or to its Emergency Relocation Site (ERS). Also, where appropriate, the effects of fallout on W2MCCS facilities are described.

D. Status of Theatre Communications (U)

1. General (U)

(U) This section is a synopsis of the communication assets available from NCA to the CINCs, and from the CINCs to their forces. They are categorized by CINC.

(U) An important point in the synopsis is that although connectivities are indicated for AUTOVON, AUTODIN, etc., our estimates for weighted communication capabilities may appear low. However, when we are taking into account physical damage, loss of alternate routes, etc., the number of available channels is significantly reduced, thereby causing low estimates of communication capability.

(U) A second point is that these tables assume that no C<sup>3</sup> reconstitution has taken place since PRIME RATE.

## GLOSSARY OF ABBREVIATIONS, ACRONYMS, AND CODE WORDS

AAFCE	Allied Air Forces, Central Europe (NATO)
ABNCP	Airborne Command Post
ACA	Automatic Conference Arranger (OJCS)
ACE HIGH	Allied Command, Europe, High Command Troposcatter Net (NATO)
ACFK	Alternate Command Facility, Kunia (PACOM)
ACTAN	Alternate CINCPAC TTY Alerting Network
ADIN	See AUTODIN
AFLANT	U.S. Air Force, Atlantic (LANTCOM)
AFREDCOM	U.S. Air Force, Readiness Command
ALCC	Airborne Launch Control Center (SAC)
ALCOM	Alaskan Command
ALCOP	Alternate Command Post
ALCS	Airborne Launch Control System (SAC)
ALFA NET	HF/SSB Communications Net (SAC)
ALT	Alternate
ALTCOM	Alternate Commander
ALTCOMLANT	Alternate Commander, Atlantic (LANTCOM)
AM	Amplitude Modulation
ANMCC	Alternate National Military Command Center (OJCS)
AREUR	See USAREUR
ARLANT	U.S. Army, Atlantic (LANTCOM)
ARPAC	U.S. Army, Pacific (PACOM)
ARREDCOM	U.S. Army, Readiness Command
AUTODIN	Automatic Digital Network (DCS)
AUTOSEVOCOM	Automatic Secure Voice Communications

AUTOVON	Automatic Voice Network (DCS)
AUXCP	Auxiliary [Airborne] Command Post (SAC)
AVON	see AUTOVON
A/C	Aircraft
A/G	Air-to-Ground
BAUD	Unit of signaling speed--the number of discrete signal events per second
BCA	Broadcast Control Authority
BMEWS	Ballistic Missile Early Warning System (NORAD)
BRAVO NET	HF/SSB Communications Net (SAC)
BRA-29	Special submarine HF receiver equipment
D'CST	Broadcast
CEMETERY NET	HF/SSB Communications Net (EUCOM)
CENTAG	Central Army Group Central Europe (NATO)
CINC	Commander-in-Chief
CINCAL	Commander-in-Chief, Alaskan Command
CINCEASTLANT	Commander-in-Chief, East Atlantic (ETCOM)
CINCEUR	See USCINCEUR
CINCHAN	Commander-in-Chief, Channel (NATO)
CINCLANT	Commander-in-Chief, Atlantic Command
CINCNORAD	Commander-in-Chief, North American Air Defense Command
CINCONAD	Commander-in-Chief, Continental Air Defense Command
CINCPAC	Commander-in-Chief, Pacific Command
CINCPLACFLT	Commander-in-Chief, U.S. Pacific Fleet
CINCRED	Commander-in-Chief, Readiness Command
CINCSAC	Commander-in-Chief, Strategic Air Command
CINCSCO, CINC SOUTH	See USCINCSO
CINCUSAFE	Commander-in-Chief, U.S. Air Force, Europe
CLARINET	
PILGRIM	Real-time relay of CSUB broadcast (PACOM)

COMANTDEFCON	Commander, Antilles Defense Command (LANTCOM)
CONCENTLANT	Commander, Central [East] Atlantic (SIATO)
COMCRUDESANT	Commander, Cruiser-Destroyer Forces, Atlantic (LANTCOM)
COM EASTLANT	Commander, East Atlantic (LANTCOM)
COMFAIRWESTPAC	Commander, Fleet Air, Western Pacific
COMFAIRWING-LANT	Commander, Fleet Air Wing, Atlantic (LANTCOM)
COMIDFOR	Commander, Iceland Defense Forces (LANTCOM)
COMINEWARFOR	Commander, Mine Warfare Forces (LANTCOM)
COMKWSFOR	Commander, Key West Forces (LANTCOM)
COMMANDO ESCORT	Air Force HF/SSB Voice Network
COMNAVAIRLANT	Commander, Naval Air Forces, Atlantic
COMNAVAIRPAC	Commander, Naval Air Forces, Pacific
COMNAVFORJ	Commander, Naval Forces, Japan
COMPHIBPAC	Commander, Amphibious Forces, Pacific
COMSOLANT	Commander, South Atlantic (LANTCOM)
COMSUBEASTLANT	Commander, Submarine Forces, East Atlantic (EUCOM)
COMSUBFLOT 8	Commander, Submarine Flotilla 8 (LANTCOM)
COMSUBLANT	Commander, Submarine Forces, Atlantic
COMSUBPAC	Commander, Submarine Forces, Pacific
COMSUBRON 15	Commander, Submarine Squadron 15 (PACOM)
COMUSJ	Commander, U.S. Forces, Japan
COMWESTSEAFRON	Commander, Western Sea Frontier (PACOM)
CONAD	Continental Air Defense Command
CONUS	Continental United States
CP	Command Post
CRCS	Custodial Radio Control Station
CSF-8	See COMSUBFLOT 8
CSUB	Pacific Submarine Broadcast
CTAN	CINCPAC Teletype Alerting Network

QVA	Attack Aircraft Carrier
CVAN	CINCPAC Voice Alerting Network
C <sup>3</sup>	Command, Control, and Communications
DCA	Defense Communications Agency
DCPA	Defense Civil Preparedness Agency
DCS	Defense Communications System
DIN	See AUTODIN
DNA	Defense Nuclear Agency
DSCS	Defense Satellite Communications System
DSP	Defense Support Program
EAM	Emergency Action Message
